

MEDICAL TRANSCRIPTION

Doctor: Good morning. How are you feeling today?

Patient: Good morning, Doctor. I'm feeling a bit better, but still a bit weak.

Doctor: That's expected after a cardiac event. I reviewed your reports, and it seems like you had a mild cardiac arrest. Thankfully, we caught it early. How's the chest pain now?

Patient: It's much less than before, just some slight discomfort at times.

Doctor: That's good to hear. I'm going to prescribe you some medications to help stabilize your condition and prevent further complications.

Patient: Okay, Doctor.

Doctor: First, you'll be taking **Angispan TR 2.5 mg**, once daily in the morning before food. This will help prevent angina and reduce the heart's workload.

Patient: Alright.

Doctor: The next one is **Lipvas 40 mg**. You need to take it once daily at bedtime. This will help lower your cholesterol levels and prevent heart complications.

Patient: Got it.

Doctor: I'm also prescribing **Nicodil**, to be taken twice daily after meals. It's a vasodilator that improves blood flow and reduces heart strain.

Patient: Twice a day, right?

Doctor: Yes, exactly. And finally, **Dytor Plus 10 mg**, to be taken in the morning. This is a diuretic that helps manage fluid retention and reduces blood pressure.

Patient: Okay, I understand.

Doctor: Along with these medications, make sure you maintain a low-sodium, low-fat diet. Avoid any strenuous activities for at least six weeks. Regularly monitor your blood pressure and cholesterol levels.

Patient: I'll do that, Doctor.

Doctor: Also, schedule a follow-up visit in two weeks for a review. If you feel any chest pain or discomfort before that, don't hesitate to seek immediate medical attention.

Patient: I will. Thank you so much, Doctor.

Doctor: Take care, and get plenty of rest. We'll make sure you recover well.
